General Resources Views Notes Further reading Articles Other resources External links Category:Computer hacking in the United States Category:Privilege softwareHijacked aircraft are frequently used by terrorists or other criminals to spread infection across areas of large cities and other countries. The perpetrators may send an infected substance through the mail, or they may hide their infected substance in other luggage or clothing. Once an infected substance arrives in a mailroom or a ticket checkpoint, however, it is extremely difficult to prevent the substance from spreading undetected to other people. Airlines have increasingly been the target of terrorist attacks using hijacked aircraft in order to spread a virus or a microorganism. For example, there are multiple reports of exploding on board airplanes over the past several years. There are various ways that a virus or other microorganism can spread. A common way for a virus to spread from one person to another is to touch and/or inhale some of the persons' bodily fluids, and then to touch his or her mouth or nose. In this way, a person may inadvertently ingest the virus or other microorganism from an infected passenger when he or she touches his or her mouth and/or nose. Once ingested, the virus can enter the body through the digestive or respiratory systems. Accordingly, there is a need for a system and method for detecting the possibility that an airborne microorganism or virus is spreading within a passenger compartment of an aircraft.The present invention relates to a vacuum cleaner, in particular a domestic vacuum cleaner. Vacuum cleaners which are used for cleaning ceilings and walls are known. The vacuum cleaner is equipped with a suction head which has a brush located on its underside. In the case of the known vacuum cleaners, the suction head is supported by a handlebar in such a way that it can be pulled along in the direction of the floor and, in this way, be moved over the floor so that the brush can be moved over it. It has emerged that, on the one hand, such conventional vacuum cleaners have the drawback that the brush frequently picks up dirt lying on the ceiling or wall, which is consequently removed with the dirt from the floor. On the other hand, the suction head which is used for this purpose is relatively expensive and is difficult to maintain.Survival rates for patients with non-small cell lung cancer (NSCLC) treated with stereotactic body radiation therapy (f30f4ceada
