Core and add-on applications. AutoCAD's Professional, Standard and Architectural subscription levels were replaced in 2011 with the Business Edition and Entry-level editions. AutoCAD 2012 is based on the new Add-on Model and is no longer a subscription product. AutoCAD had a number of free visual programming tools for programming the draw commands of AutoCAD in 1994. These included the AutoCAD II Macro language and Visual Basic for Applications. In 2006, Autodesk launched the application called MATLAB (Matrix Laboratory) for the use of mathematical functions. AutoCAD is available for free with a subscription to the MATLAB software. In 2009, Autodesk acquired the cross-platform AutoCAD-based design and engineering software company, Trimble. In 2010 Autodesk acquired GPS data services provider, United Software Corporation. In July 2010 Autodesk launched AutoCAD 360, offering a similar user experience as AutoCAD. In May 2012 Autodesk acquired Autodesk 360, an architectural animation software application which was added to AutoCAD in 2016. Visual Programming Tools In 1994, Autodesk released a visual programming tool for AutoCAD called AutoCAD II Macro. A similar tool was released for Visual Basic. AutoCAD II Macro was based on Visual Basic programming. It used the term "macro" to describe these types of tools. This was the predecessor to AutoLISP. AutoCAD II Macro was discontinued on November 1, 2000. However, the Macro programming environment remains in AutoCAD today. AutoLISP Autodesk first launched AutoLISP in 1992. Autodesk bought AutoLISP from Mitchell Faber Systems on April 1, 1994. Autodesk added a number of features to AutoLISP. These included support for an object-oriented programming language, automatic compiler and support for object-oriented development and modeling. AutoLISP was discontinued on November 1, 2000. Visual Basic In 1994, Autodesk released Visual Basic for Applications for AutoCAD. Visual Basic for Applications was discontinued on November 1, 2000. Visual Basic was replaced with AutoCAD's Macro programming language in 1997. Autodesk Exchange Apps Autodesk Exchange Apps is a platform for distributing AutoCAD plug-ins. It allows third-

I am new to java and still trying to understand how/why things work. As I understand it, when a constructor is invoked on a class, it is supposed to create a new object of that class. In this case, it will create a new "Game". It then creates a new "Player" inside the constructor. In the constructor of the Player class it calls another constructor, of "Vehicle". This calls the "Vehicle" constructor. What I don't understand is why both classes use the same constructor. Are they both using the same constructor because they both have "Vehicle" as a superclass? And are constructors only allowed to create one object of a class? I tried to figure it out by searching on the internet, but couldn't find a answer that explains why this works.

```
public class Vehicle {
    private final int numberOfWheels;
    private int numberOfPassengers;
    public Vehicle(int numberOfWheels, int numberOfPassengers) {
        this.numberOfWheels = numberOfWheels;
        this.numberOfPassengers = numberOfPassengers;
    }
}
public class Player extends Vehicle {
    public Player(int numberOfWheels, int numberOfPassengers) {
        super(numberOfWheels, numberOfPassengers);
    }
}
public class Game {
    public static void main(String[] args) {
        Player p = new Player(4, 4);
        p.print();
        Vehicle v = new Vehicle(4, 4);
    }
}
```

What's New In AutoCAD?

The option to import comments from paper drawings, like the one shown above, is now included in the Drawing Settings. This feedback import capability is only available when the drawing is created in a session. Note: The Import Options in the Drawing Settings dialog can be used to import comments when you create a new drawing, when you import an existing drawing, or when you start a session. Previous markups on parts of the drawing can be saved to a.MANG file and recalled during the same session. The -M2 and -M3 commands in the command line, and the "Assist Markup" tool in the commands palette, now support this feature. In the Markup Assist tool, these three options are now supported: – Follow Previous Markup –

Follow Comments – Follow Thumbs Up – Support for Markup Assist on the Export For Web (EFW) dialog and Export For Web (EFW) command line is coming soon. (video: 2:48 min.) User Interface Changes: Additional options are available in the Add/Update Comment and Comment Settings dialogs. Batch changes to comment text can now be handled with a single click. The double-click action is no longer available for commenting. You must now press Shift+DoubleClick for this functionality. The Show/Hide Changes View (Ctrl+H) function is now available. The Draw Text function now updates the next object after text or annotations is drawn, rather than the first object. The Select Menu functionality has been updated to support circular selections. Annotation Tool Changes: You can now position and scale annotation strokes by dragging and moving them on the screen. A brand new drawing view is available for easily moving your annotation strokes with a single click. This view, called “Straight Segment,” is now part of the Markup View. When drawing an annotation, the cursor is no longer displayed over a guide line. This behavior is disabled until you click on a point in the drawing to create a new annotation. Annotation line color and weight are now changed when the first anchor point is moved. You can now edit the annotation text and labels in-place as you create them.
