----- PicName is a freeware application written in Visual Basic 6.0. PicName came into existence as a result of the fact that, when you load camera files onto your PC, this is a necessary part of getting them onto your PC. Yet, most of the time, after taking the photos and videos, you might also want to perform certain operations on them. Like, for instance, you might want to rename the photo so you can remember what you photographed. Or you might want to resize it so you can include it on your website or send it to your friends. Or perhaps you want to rotate it 90° or 180° so it'll fit better with your other photos. Or you might want to change the format of the photo to JPG so you can include it in your e-mail. As you can see, there are many operations you might want to perform on these files that might otherwise be rather cumbersome and time consuming. But, when you're loading/editing/deleting pictures/videos, it's a bit of a chore to remember that there's no time to click a button, so you can perform these operations more efficiently. If you want to make it even easier, then you should certainly give PicName a try. Be warned that this program is very memory intensive, so a big collection of files might cause a performance hit, slowing your PC down. So, you might want to make sure you've done a fresh clean install of Windows, before loading an unwieldy collection of images. But let's first see how to load a picture onto PicName's preview window. Load a Picture ----- The easiest way is to select a file from your computer, by pressing Ctrl+A. Or you can use the File Open dialog that's located in the upper-right corner. A selected image is then displayed in the preview window in the upper-left corner. Drag a file from Windows Explorer/My Computer directly onto the preview panel or use the Open button from the Preview Menu, to select a file. As long as you're dragging a file from Windows Explorer/My Computer directly into the preview panel, the file is opened. When using PicName's Load button in the Preview menu, the selected file is opened and then the preview panel is filled with the image, moving the preview panel into position. Alternatively, you can drag a selected image file from Windows Explorer directly onto PicName's preview panel.
