Soft tissue sarcomas are classified as high grade, intermediate grade and low grade [[@RJVO52C2]]. The current treatment option is either wide resection with or without resection of adjacent structures and without adjuvant radiotherapy for low-grade tumors and en-bloc resection with adjuvant radiotherapy for high-grade tumors [[@RJVO52C2]]. Metastatic disease is frequent and characterized by locally advanced, often bulky, tumors. Treatment consists of en-bloc resection and may include resection of adjacent organs (stomach, liver, large intestine, bladder, kidney) [[@RJVO52C3]]. Resection is often associated with post-operative short bowel syndrome with high post-operative morbidity and mortality. In a previous case report we described a successful conservative treatment in a patient with unresectable soft tissue sarcoma of the stomach [[@RJVO52C4]]. In the current case report we present the long-term results of this treatment. CASE REPORT (#s2) ===== A 58-year-old man with progressive weight loss of 5 kg in 6 months was admitted to our institution. A physical examination revealed an enlarged sub-mucosal tumor of the stomach. He had a history of multiple pulmonary metastases. An upper gastrointestinal endoscopy revealed a gastric submucosal mass. Magnetic resonance imaging (MRI) demonstrated a 5 cm gastric submucosal tumor (Fig. [1]{#RJVO52F1}{ref-type="fig"}) involving the gastric body. No distant metastases were observed. The patient was referred to our department for further therapy. Figure 1:T2-weighted MRI scan of the upper
