I have a simple script which is supposed to do a few batch commands on a linux machine remotely. The script is supposed to execute 3 commands. Here they are: #!/usr/bin/env python import subprocess COMMAND_LIST = ['mkdir','mkfifo', 'touch'] i = 0 while True: try: command = COMMAND_LIST[i] subprocess.Popen(command) i = i + 1 except IndexError: break It is run like this: python run.py The issue is that for unknown reasons, the command seems to freeze. The odd thing is that the output of the command is visible in the shell, but after a while, it seems like it freezes. Running commands manually works fine. I have no ideas why this happens, so I'm happy for any ideas or suggestions. A: A possible issue would be timeout. The script stops because it takes too long (timeout). This can be caused by high cpu load on the server or by an external timeout. To check that you could use ps: ps -ef | grep python and see what gets logged. If you see something like: python then you have a timeout issue. If you see a different process than python you have a system issue (e.g. the wrong permissions on the files created). If you see no logging or a different process than the one you expect, then there is a high cpu load issue. A: "Running commands manually works fine." -- but no mention of what, precisely, is the difference in behavior between the "manual" commands and the system calls in your example. It's quite possible that the normal Unix subprocess.Popen calls will succeed while the calls in your example will fail. The usual mechanisms for dealing with timeout/non-success behavior e79caf774b

ItÂ .Q: How to prevent interface data loss when an object is dropped on a window I am programming a game using Game Maker Studio and I've decided that I want to implement a cursor. Cursors are fairly easy to implement with GDK2, however I am not sure how to prevent my interface from breaking when I drop an object on to the window from which it was generated. If I drop an object on to the top-left corner of the window, this is an easy problem to solve: I would simply set the position of the window such that that it never ends up covering any of the buttons in the window. However, if I drop the object on to the bottom-right corner, the interface behind the windows are no longer visible: In GDK2, it should be possible to have code such as the following: if(GetMouseDirection() == gdk_mouse_get_direction(gtk_widget_get_focus_path(GTK_WIDGET(get_active_window())))) And then when the window is dropped, ensure that the position is changed appropriately. However, it does not look like gdk_mouse_get_direction() is ever called during interface redraws, and thus the window becomes completely immovable afterwards. The best way I've managed to get around this problem is by setting the coordinates of each button manually when the mouse is clicked. I did this by treating each button like a separate object. This works great, but is a bit on the tedious side of things. Is there any way to easily prevent this from happening? A: Unfortunately, as you mentioned, GTK doesn't
