goldcut jk series .README.md CASK CASK is a VCS system, but not  
like you've ever used before. Here's how it works: 1) You open a file  
and start writing. 2) You change your mind. 3) You save your file. 4)  
You don't worry about merging it with other files. 5) You can tell  
CASK to automatically update a bunch of other files, if you like. 6)  
You can email a link to your friends, or post it on your blog, or  
whatever. 7) CASK checks out a whole bunch of files in your  
repository, and returns a URL you can use to check out just the files  
you want. Great, right? So how does CASK work? It's just a shell  
script. You run it like this: \$ caskserver [options] [ ...] [options] are  
the 'server' options. 'Set' and 'Unset' for local changes only,  
'Configuration' for the whole repository. The file is any file the server  
understands: html, jpeg, pgg, php, cgi,... The shell is the user's shell,  
not the server's. This is important: you can edit the server's.login file  
to make it your default shell instead, just like you can with any unix  
server. There is no server-side checking. When you save your file,  
it's transferred to the server, where CASK builds up a list of what was  
saved and tells the server what files to check out and keep. Then it  
returns a list of URLs you can use to check out the new version. This  
way, there's no server-side checking of any kind. The server is like a  
text-only version of the 'Net. Any changes you make to the  
repository are stored on the server, then 'returned' automatically to  
any user who asks for them. The end result is: a text-based version  
of the Internet, where you aren't limited to the servers that go along  
with d0c515b9f4

0-Q: c# Winforms detect mouse click in multiview I've got a  
multiview that can be expandable when the form opens, but I want  
to know when the user clicks in the multiview. This code isn't  
working. When I click in the view, it doesn't detect the click. private  
void MW\_MouseWheel(object sender, MouseEventArgs e) { if  
(e.Button == MouseButton.Right) { if (e.Delta > 0) {  
MW.BeginUpdate(); MW.Panel1.Location = new  
Point(MW.Panel1.Location.X, MW.Panel1.Location.Y - e.Delta);  
MW.Panel1.Size = MW.Panel1.Location.X \* MW.Panel1.Location.Y;  
MW.Panel1.Refresh(); MW.EndUpdate(); } else if (e.Delta
