Unfortunately, I cannot evaluate whether the new Touch Lens, Lens Blur, and Lens Correction tools are worth using or not. I took Photoshop Sketch for the iPad out of consideration not because I am not interested in the new features that they offer. I am, in fact, very fond of those, but I am also rather picky about tools. But even if Photoshop Sketch were to have been the one tool I needed, I would have had to get my hands dirty with a new tool. You see, this is my current workflow: when I want to work on my photographs, I get my laptop or desktop camera, ask it to take a number of images and, once I am done editing them, I send them to Lightroom. Then I improve further on the images in Lightroom using the software's advanced tools, which I prefer to use even on desktop computers, and save them back to my laptop. In the end, I bring everything to a single place, where all the files are synced to my Dropbox account. Then I take a screenshot of the final image and post it. That's my process and that's how I edit my files. It is what I feel comfortable with, and it saved me some $700 a year, I am sure. Luckily, there are some tools that I believe have just the right taste. Somewhere deep in the app's interface, there is a button that takes me to the "Browse" window, and I am in heaven. The Browse button looks a bit weird in action, since it is actually on the left side when we are on the main editing screen, but it works despite that. This window is quite a joy. From there, you can edit the metadata, search for EXIF data and, if the photo is local, see the RAW image's Viewer window. The latter is even more useful when a photographer uses a camera like the Samsung S8 .

However, this isn't enough yet. Although the drivers for WebGPUs are mature, we need to see some examples and broader end user adoption to find out when the benefits are truly noticeable to end users (and to web developers!). We are committed to making this a more streamlined experience and are working hard with browsers and vendors to make it happen! The latest releases continue to build on Adobe's strengths and provide advanced photo editing features. This update includes compositing features and image retouching tools, a new rendering engine, file format improvements, adaptive rendering, and unique content-aware editing commands. These new features make it easier to quickly edit big images and deliver the kind of results that are defined by photography and painting, day in and day out. Pros appreciate these tools for the same reason pros use Photoshop in the first place – to explore and create uncommon methods that go beyond the limitations of the average kit. And pros can use them on a daily basis to quickly go from raw files to finished images. In professional photography, Photoshop's adjustments make a difference down to the last pixel. Exposure, white balance, gradation, and shadows and highlights across wide color gamuts are just a few of the creative decisions that make the difference in fast-paced documentary environments. And the

inclusion of new filmic stylistic features lets you add a retro, cinematic, or creative flair that makes your images visually outstanding. Image rendering, too, has been dramatically improved as Photoshop now interprets the alpha channel and supports GPU rendering. This single feature alone has the potential to significantly reduce file sizes. When you pair all of these advancements, Adobe's overall attitude of new, updated and stable releases with comprehensive support institutions at Adobe means that Photoshop remains the ultimate tool for professional photographers.
