Field of the Invention The present invention relates to a method of manufacturing a semiconductor device, and more particularly, to a method of forming a shallow junction on a semiconductor substrate. 2. Discussion of the Related Art In general, a semiconductor device is fabricated through performing a plurality of unit processes. For example, a semiconductor chip is fabricated by a device process for forming a device region, and a wafer

process for forming a peripheral region on a main surface of a semiconductor wafer. A semiconductor wafer is fabricated by a wafer process for forming a wafer region of a device region, and a scribe region for separating an individual semiconductor chip. In the unit process of a semiconductor wafer, a semiconductor substrate is etched by a chemical process, or a diffusion region is formed in a semiconductor substrate by an ion implantation process to configure a semiconductor device. As the semiconductor device has been miniaturized, an insulation layer is formed in a narrow gap between metal lines to prevent a short circuit caused by a metal line and a step coverage is improved by high density and complexity of a semiconductor device. Thus, a dielectric 79a2804d6b
